A large, grey concrete dam with a wide staircase on its side, set against a cloudy sky and greenery. The dam is the central focus of the image, with a staircase leading up to a walkway on top. The foreground is filled with tall grass and ferns, and the background shows a line of trees under a grey, overcast sky.

How can environment-behavior studies contribute  
to enhancing societal resilience to disasters,  
including pandemics?

Ryuzo Ohno 大野隆造

Professor Emeritus, Tokyo Institute of Technology

# Natural disasters in Japan

Typhoon

Flooding

Earthquake

Tsunami

Volcanic eruption

# Major technological disasters

- Pollution by chemical substances (Ashio Copper Mine Poisoning Incident, 1891)
- Radiation leak accident (Fukushima Daiichi Power Station , 2011)
- Global Atmospheric Anomalies (Global warming)
- City fire (Great Fire of London, 1666)
- Traffic disaster (Japan Airlines jumbo plane crash, 1985)
- Pandemic (Plague, mid-14th century; [Covid-19](#))

# Resilience to disasters

When the built environment is vulnerable

When the societal resilience to disasters is greater

# Characteristics of human behavior related to disasters

If appropriate actions are taken before, during and after a disaster, damage can be minimized. To this end, it is important to understand the characteristics of human behavior related to disasters.

## ■ Risk perception and communication

- Gap between knowledge and actual actions
- Tendency not to evacuate even after hearing the warning -> Normalcy bias

## ■ Inappropriate collective behavior \* during disasters

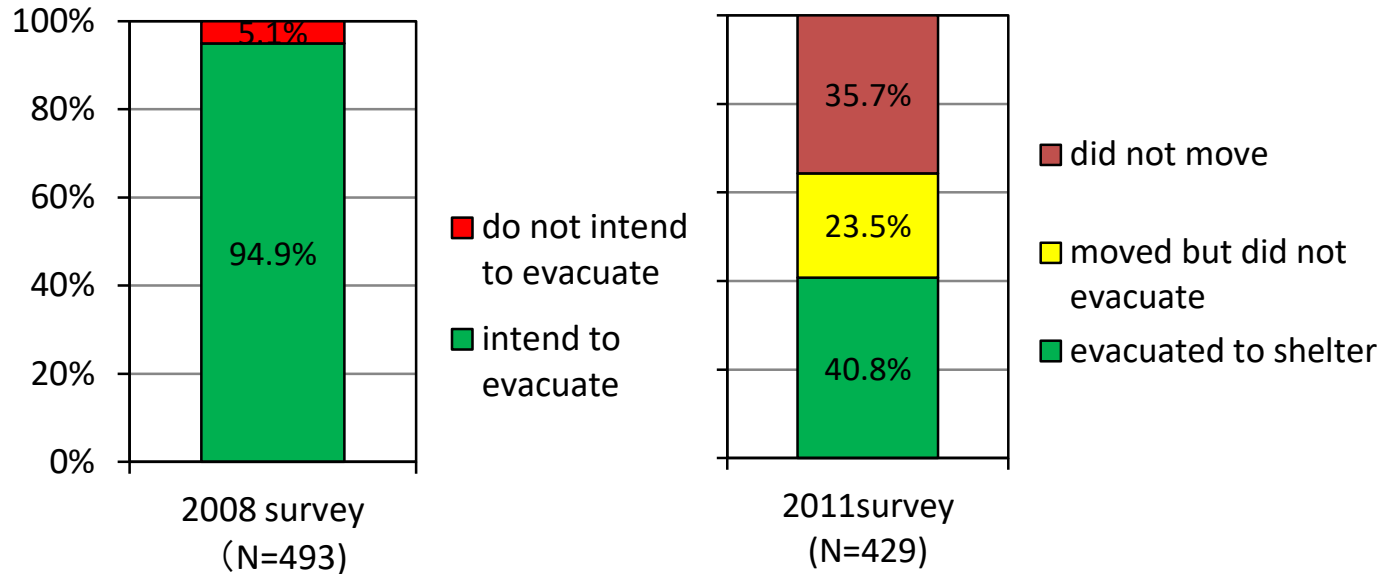

- Is it true that people panic when a disaster strikes?
- why rumors often occur during disasters ?

\* **Collective behavior**: Behavior that occurs when a large number of unorganized groups stimulate each other and uplift, including epidemics and social movements in normal times.

# Gap between knowledge and actual actions

Questionnaire survey conducted before and after the Great East Japan Earthquake in 2011

## What they do

Intention to evacuate before the earthquake

Actual evacuation rate

## How they evacuate

Means of transportation

# Tendency not to evacuate even after hearing the warning

⇒ Normalcy bias

Can we immediately judge that a sudden change in our environment is abnormal and act promptly to avoid danger?

Looking at past disaster cases, it can be seen that many people at the disaster site were aware of some sort of incident but could not determine that it was an abnormal emergency.

This is a characteristic of human behavior that is widely seen during disasters called "**Normalcy bias**".

The fire in a subway station in Daegu, Korea

# To overcome obstacles to the execution of evacuation

After receiving a warning of danger, people make the following decisions before evacuating:

- 1) Confirmation of the authenticity of information
- 2) Expected seriousness of damage
- 3) Evaluation of feasibility and effectiveness of evacuation

Evacuation is executed only when all the above three steps are positively judged.

# Is it true that people panic when a disaster strikes?

Panic has traditionally been cited as an antisocial behavior that ignores the safety of others for one's own safety, and therefore as a collective behavior that increases the damage during a disaster.

However, this extreme self-centered collective behavior rarely occurs in practice.

Recent studies of human behavior during disasters have repeatedly reported that people are more likely to evacuate in an orderly manner without panicking.

The problem is to be afraid of panic unnecessarily and hesitate to convey appropriate information.

**US Airways aircraft crash landed on  
the Hudson River on January 15, 2009**

# Why rumors often occur during disasters ?

## The cause of rumors in times of disaster:

- Inadequate information given to information needs
- Increased speculation based on psychological anxiety and worry
- Chain of actions due to confirmation of information
- Increased speed and scope of false information spread by SNS in recent years

To prevent collective behavior, it is essential to have reliable agencies provide accurate information promptly.

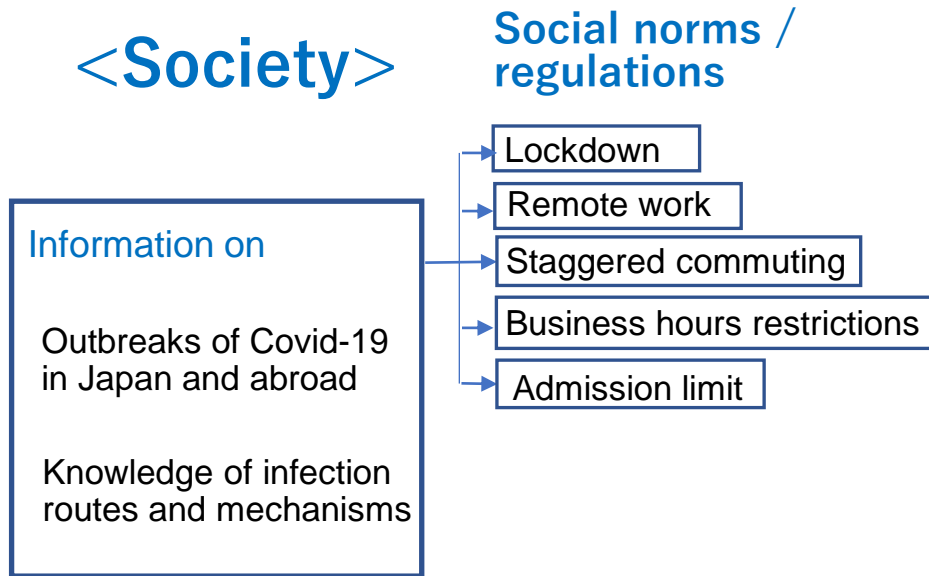

After the Great East Japan Earthquake, convenience store shelves in Tokyo that have become scarce due to excessive hoarding

# Behavioral changes caused by the Covid-19 pandemic

- Two meanings of the term "behavior change"
  - **Temporary behavior change** is an emergency evacuation behavior to avoid risk under a pandemic.
  - **Continuing behavior change** begins with the Covid-19 pandemic and continues even after convergence.
- Two possible causes of "behavior change"
  - Due to **social norms and regulations**
  - Due to **individual emotions and consciousness**

# Behavioral changes due to social norms and regulations (as a measure to avoid human proximity and contact)

# Changes in the distribution of the daytime population in Tokyo

## <Society>

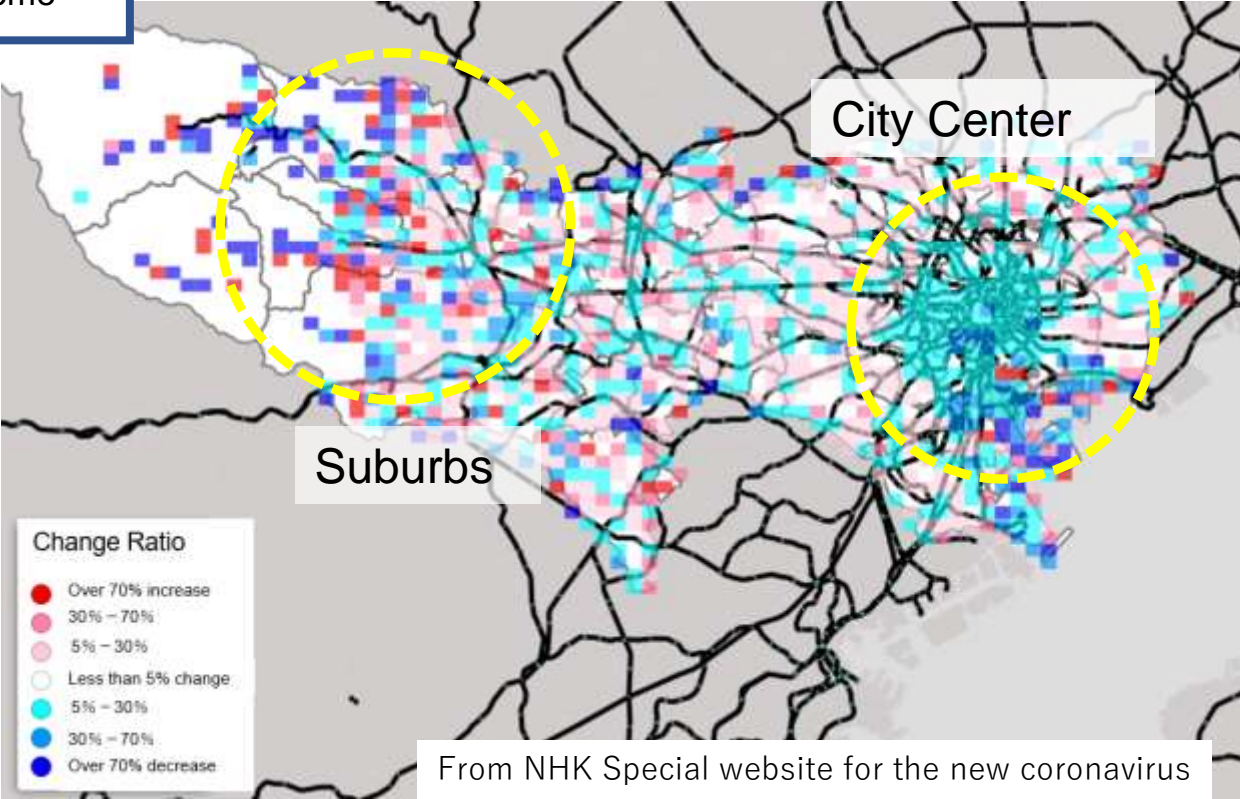

Information on  
Outbreaks of Covid-19 in Japan and abroad  
Knowledge of infection routes and mechanisms

### Social norms / regulations

- Lockdown
- Remote work
- Staggered commuting
- Business hours restrictions
- Admission limit

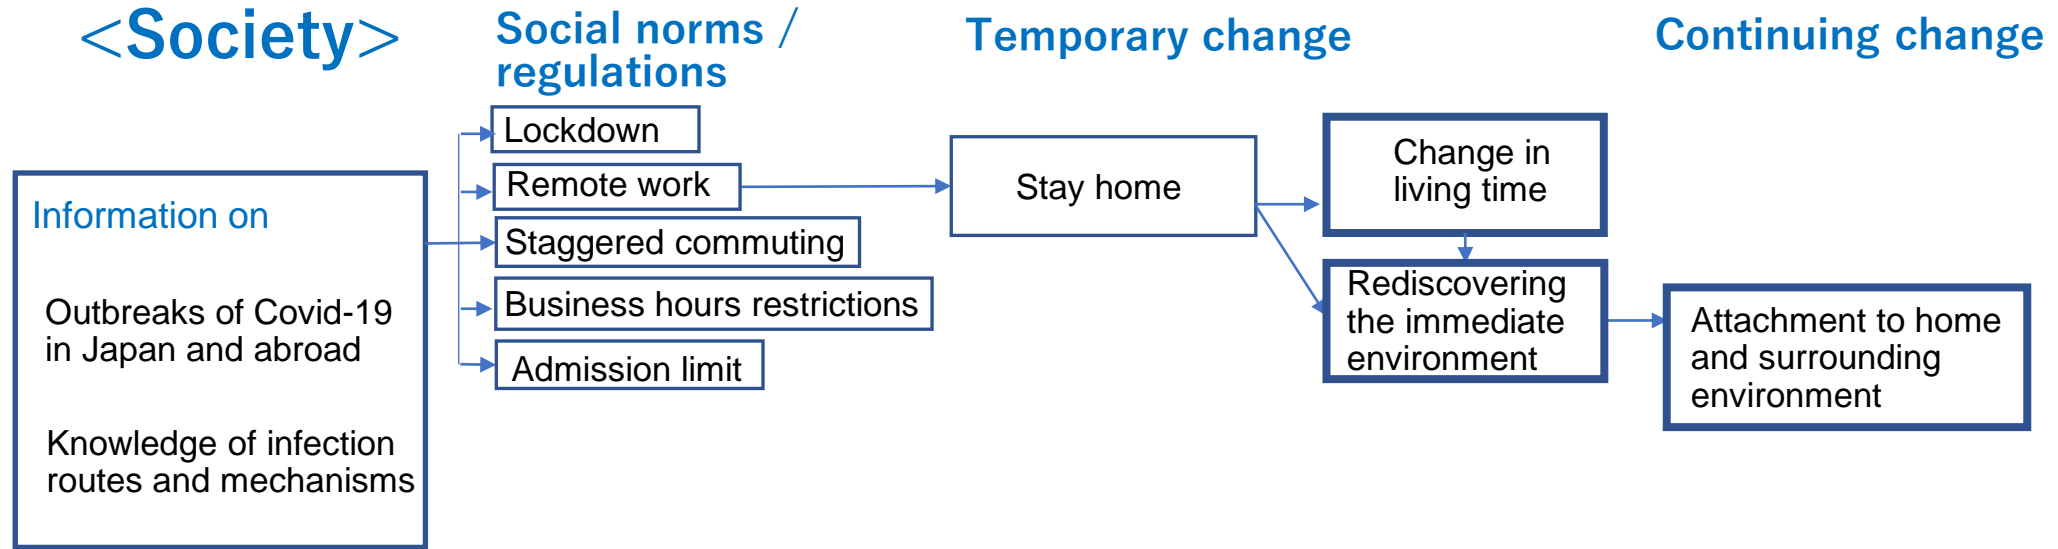

### Temporary change

Stay home

From NHK Special website for the new coronavirus

# Change in awareness of living environment due to stay home

Rich nature

Local culture

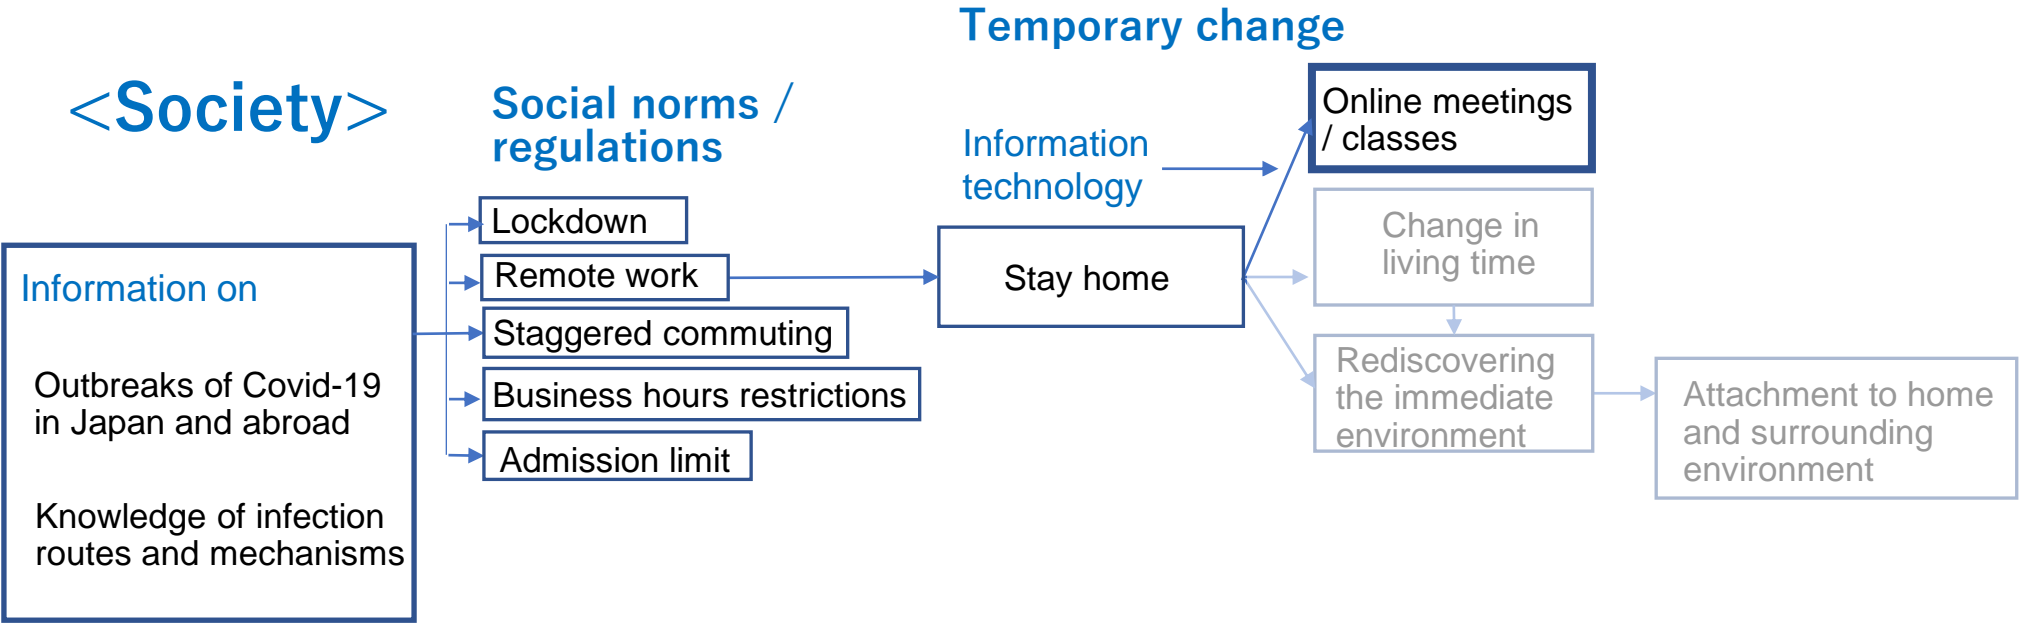

Small shop

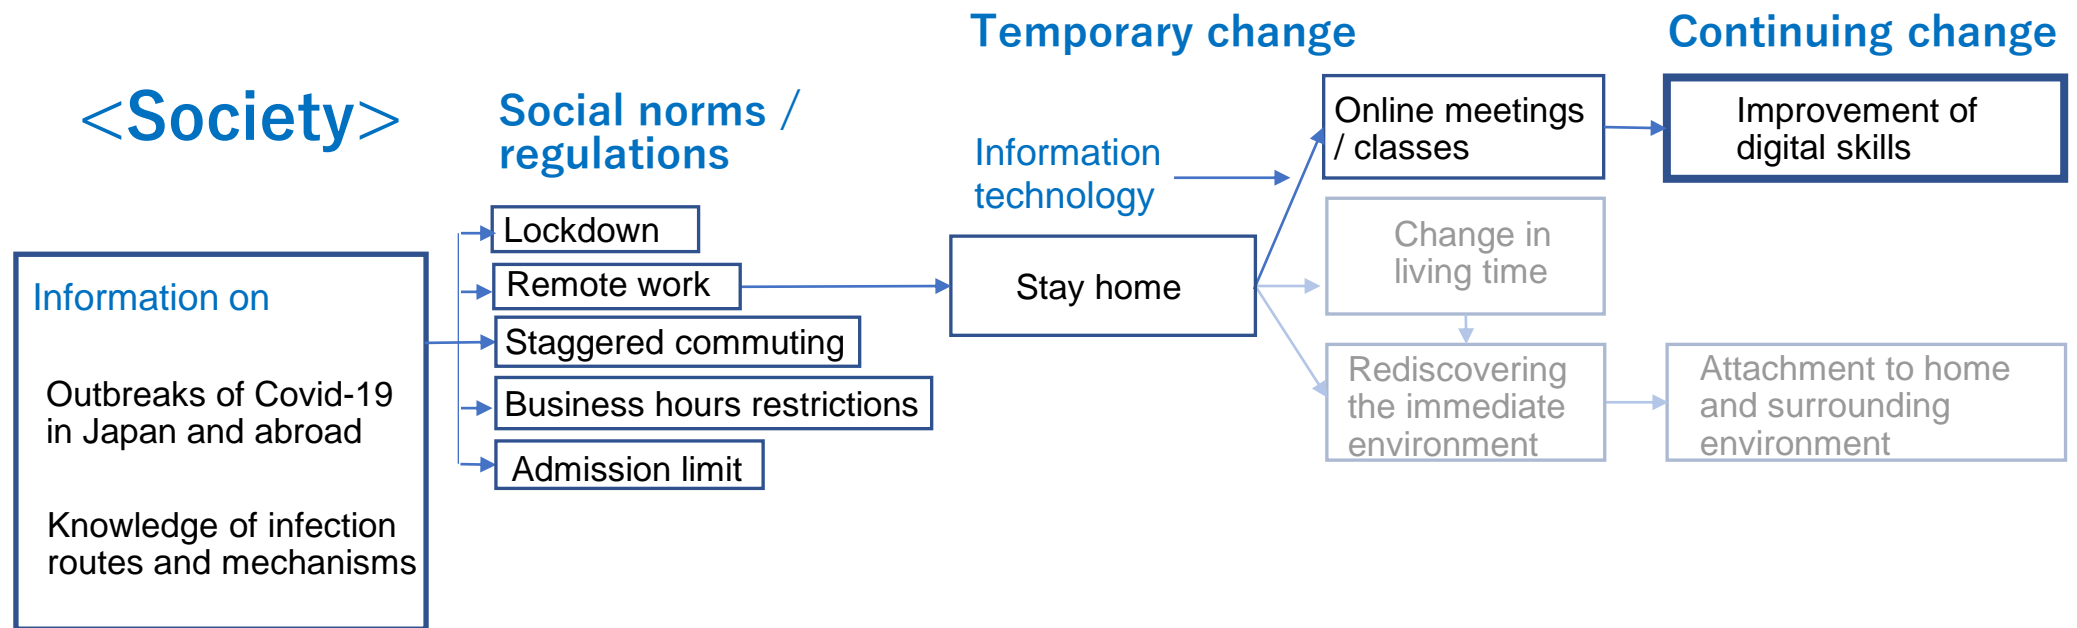

Increased use of boardwalks

# Utilization of information technology

# Improvement of digital skills

# Merits and demerits of online communication

## Merits

- Travel Time Savings
- Efficient exchange of information and reference materials

## Demerits

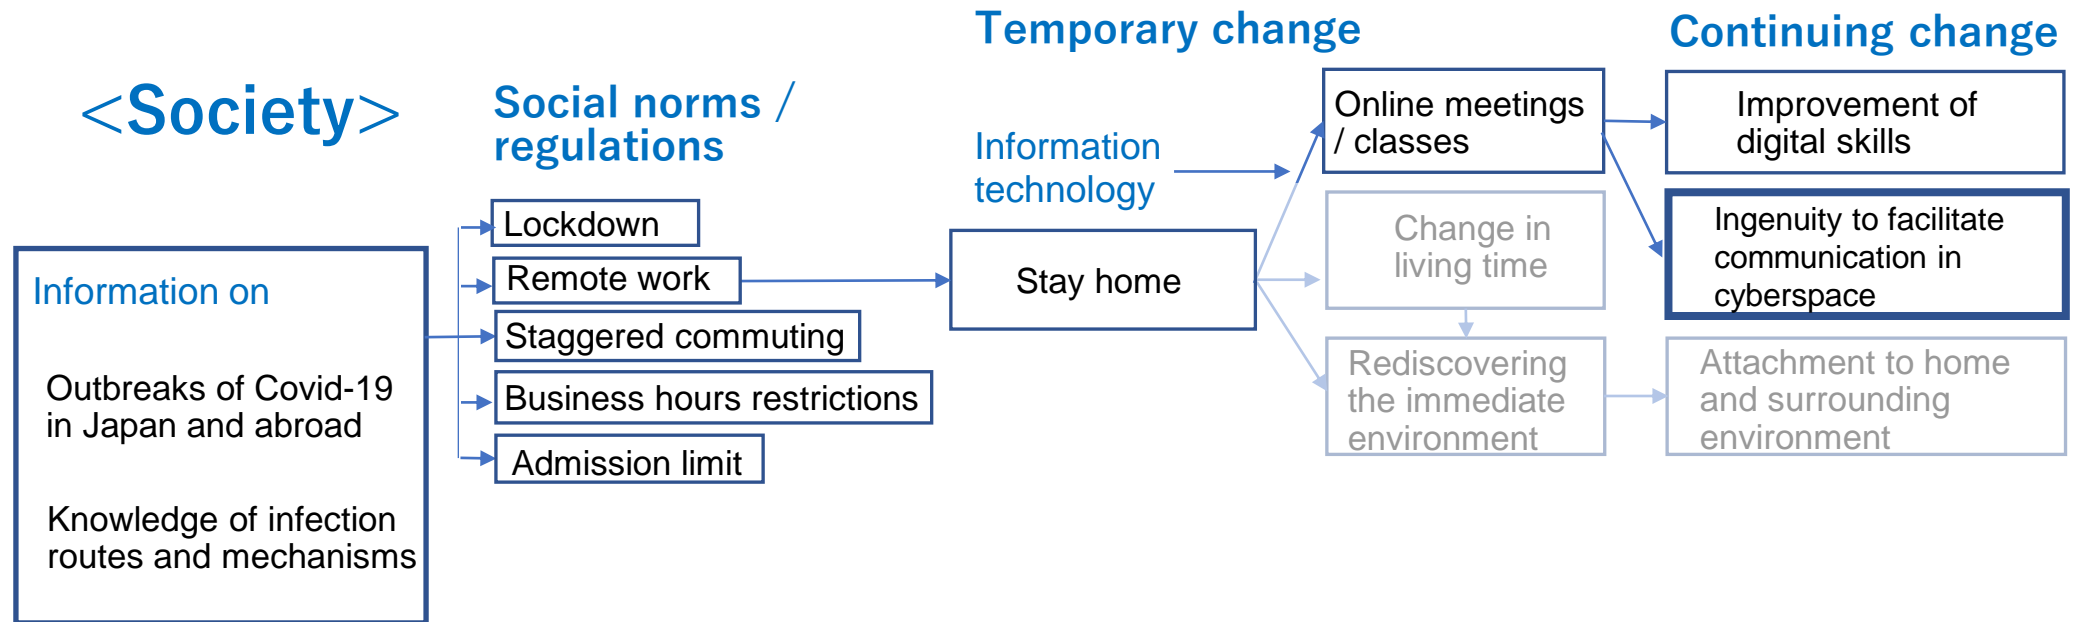

- Losing the opportunity to mentally prepare for the upcoming meeting or lecture
- Inability to convey "atmosphere" in a face-to-face space (Insufficient nonverbal communication)
- Difficulty in fostering trust and empathy among participants

In the actual room, there is margin space and time to leisurely come in and out and chat. Anthropologist Dunbar\* points out that this chat is an important part of connecting people. This may be the reason why it is difficult to foster trust and empathy among participants in online meetings with members who have never met in person.

# Ingenuity to facilitate communication in cyberspace

⇒ The latent function of margins (The usefulness of the useless)

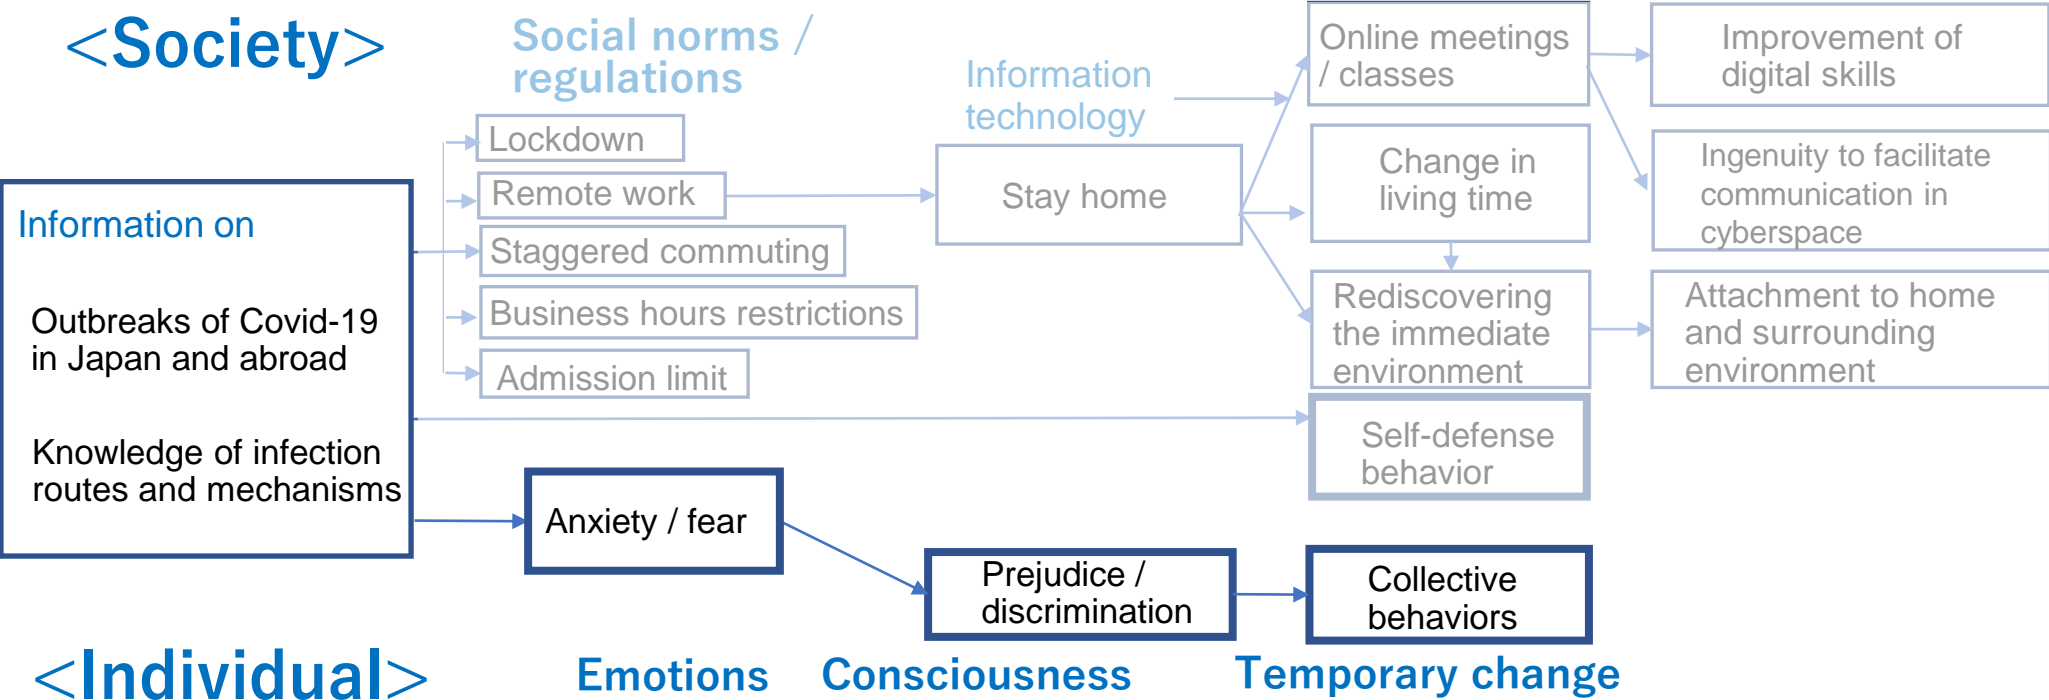

# Behavior changes due to individual emotions and consciousness

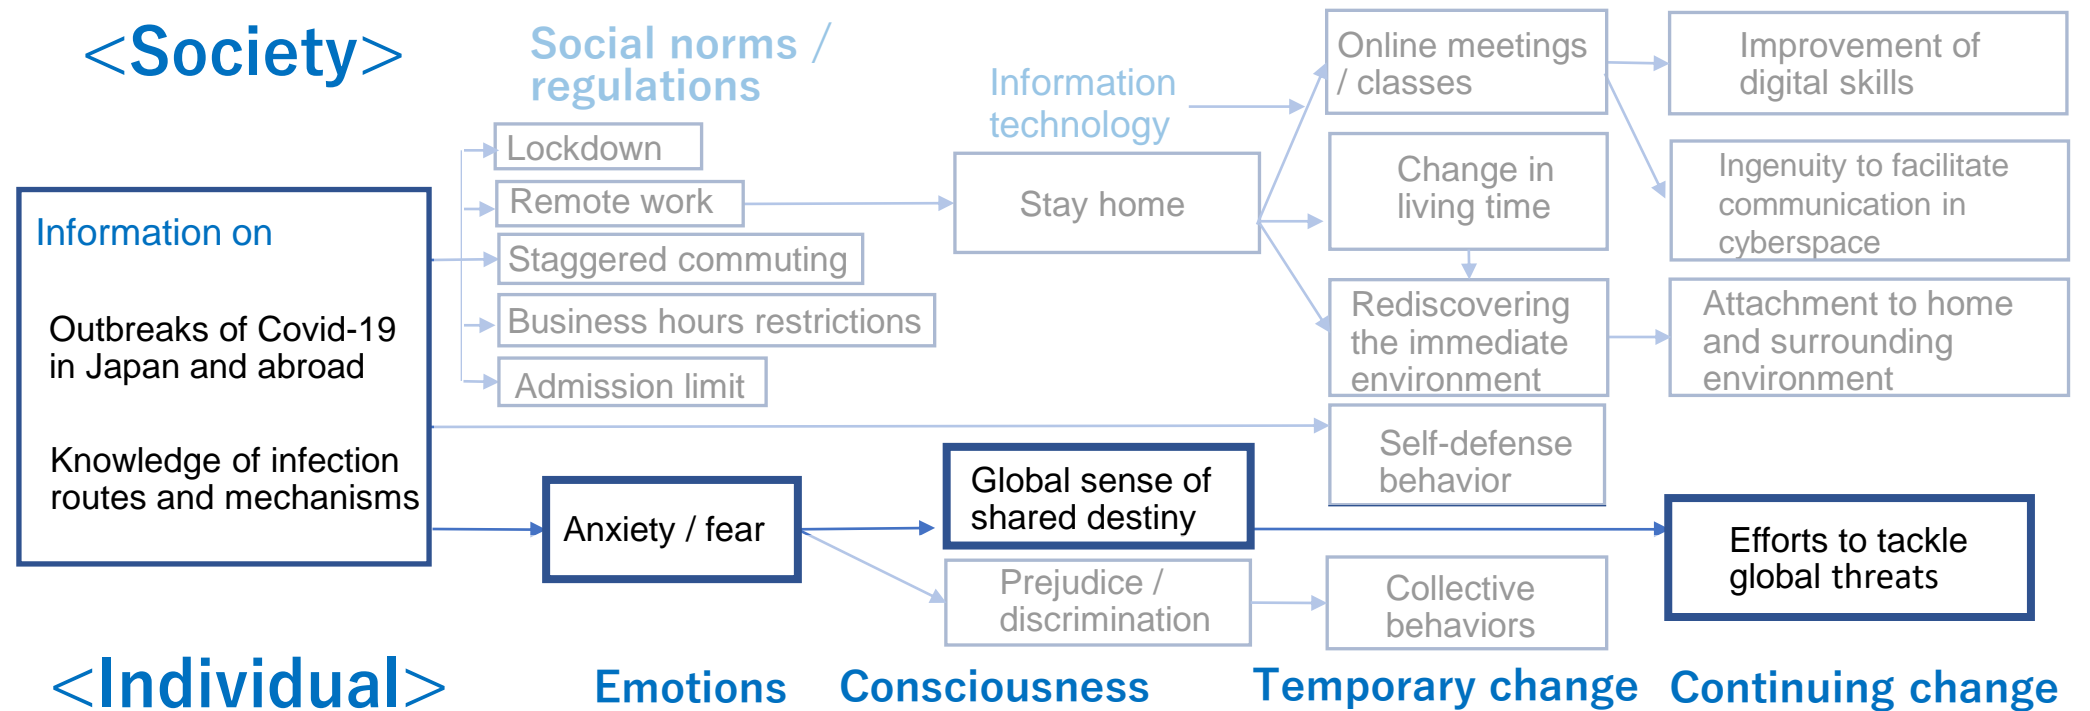

Negative emotional effects

# Collective behaviors

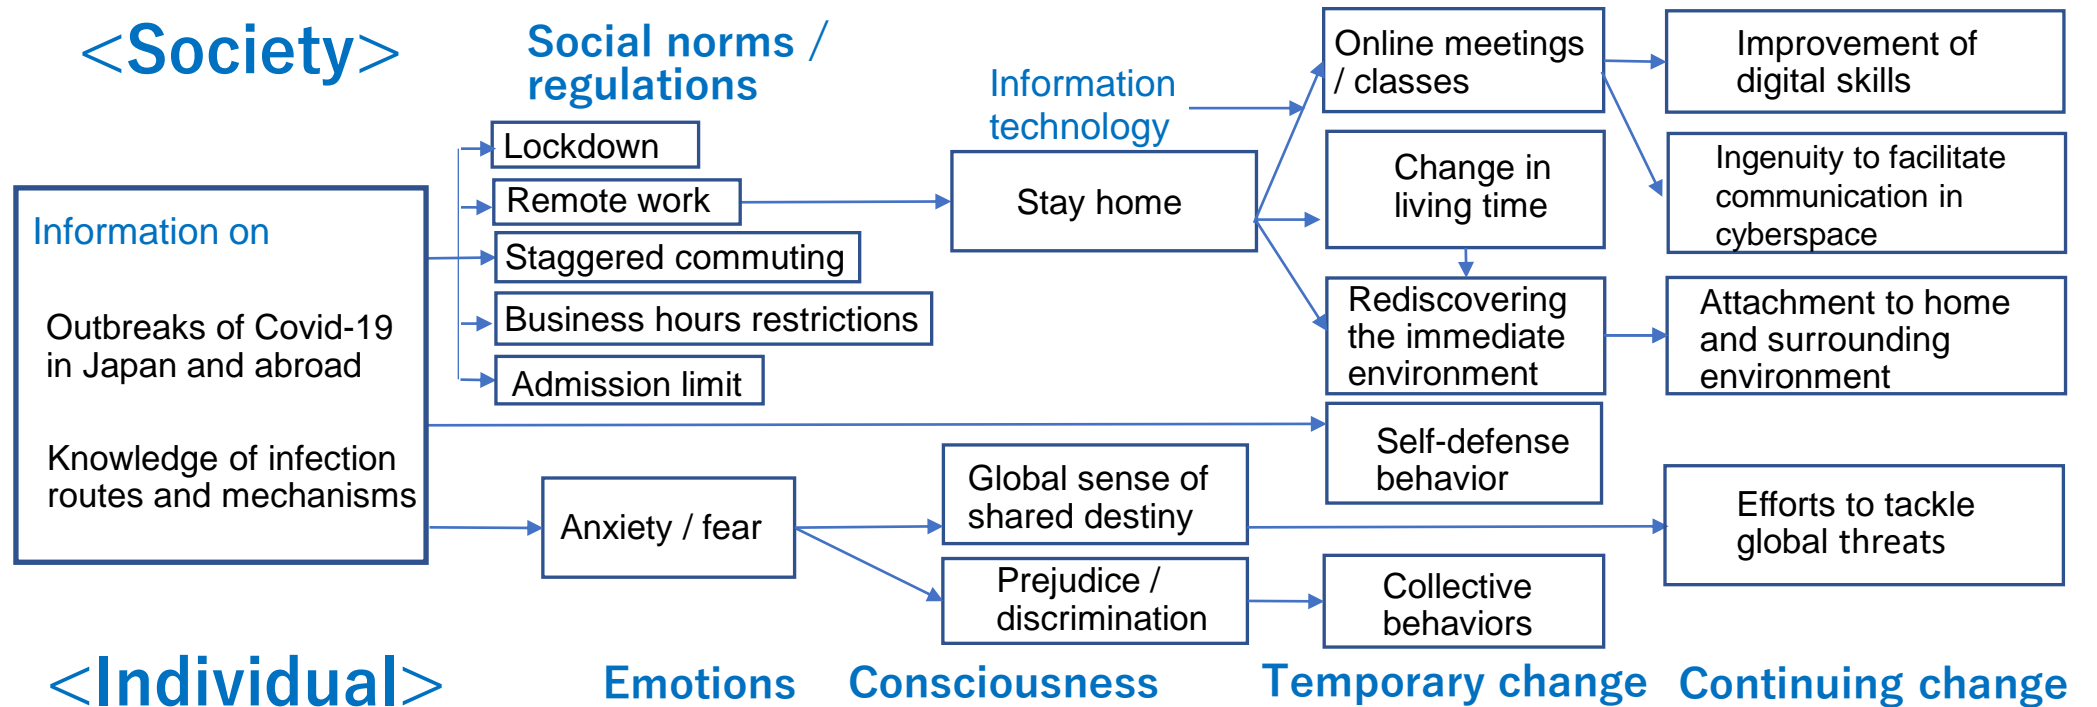

Positive emotional effects

## Leading to awareness of global threats

# Various behavioral changes caused by Covid-19 and their impact

”Think Globally, Act Locally” could be realized because of Covid-19!?

# How can EBS contribute to preparing for future pandemics?

In the future, it will always be "with Corona", not "post-Corona"

The biological world contains a myriad of viruses, 99% of which are harmless. Viruses have been involved in the evolution of organisms by passing genes to their hosts.

In this century and the next, the new coronavirus will live on. We have no choice but to continue living with coronas.

Just as natural disasters such as major earthquakes always have a certain probability of occurring, epidemics inevitably occur.

# Infection control through various **restrictions** to date

# Proposed infection control using the concept of **Behavioral Settings**

**Behavioral Setting** is the unit of analysis for clearly grasping what kind of standing pattern of behavior is repeated in what kind of place, by whom, in what time zone.

Considering architecture as an intertwined set of many behavioral settings, it would be possible to identify hotspots of infection risk in the architectural space at the behavioral setting level.

# Steps to identify Behavioral Settings at high risk of infection

1) Identify the behavioral circuits of the various users of the building

2) Identify behavior settings along the circuits

3) Identify standing pattern of behavior and examine the risk of infection at each behavior setting

Facility managers are to be aware of the specifics of

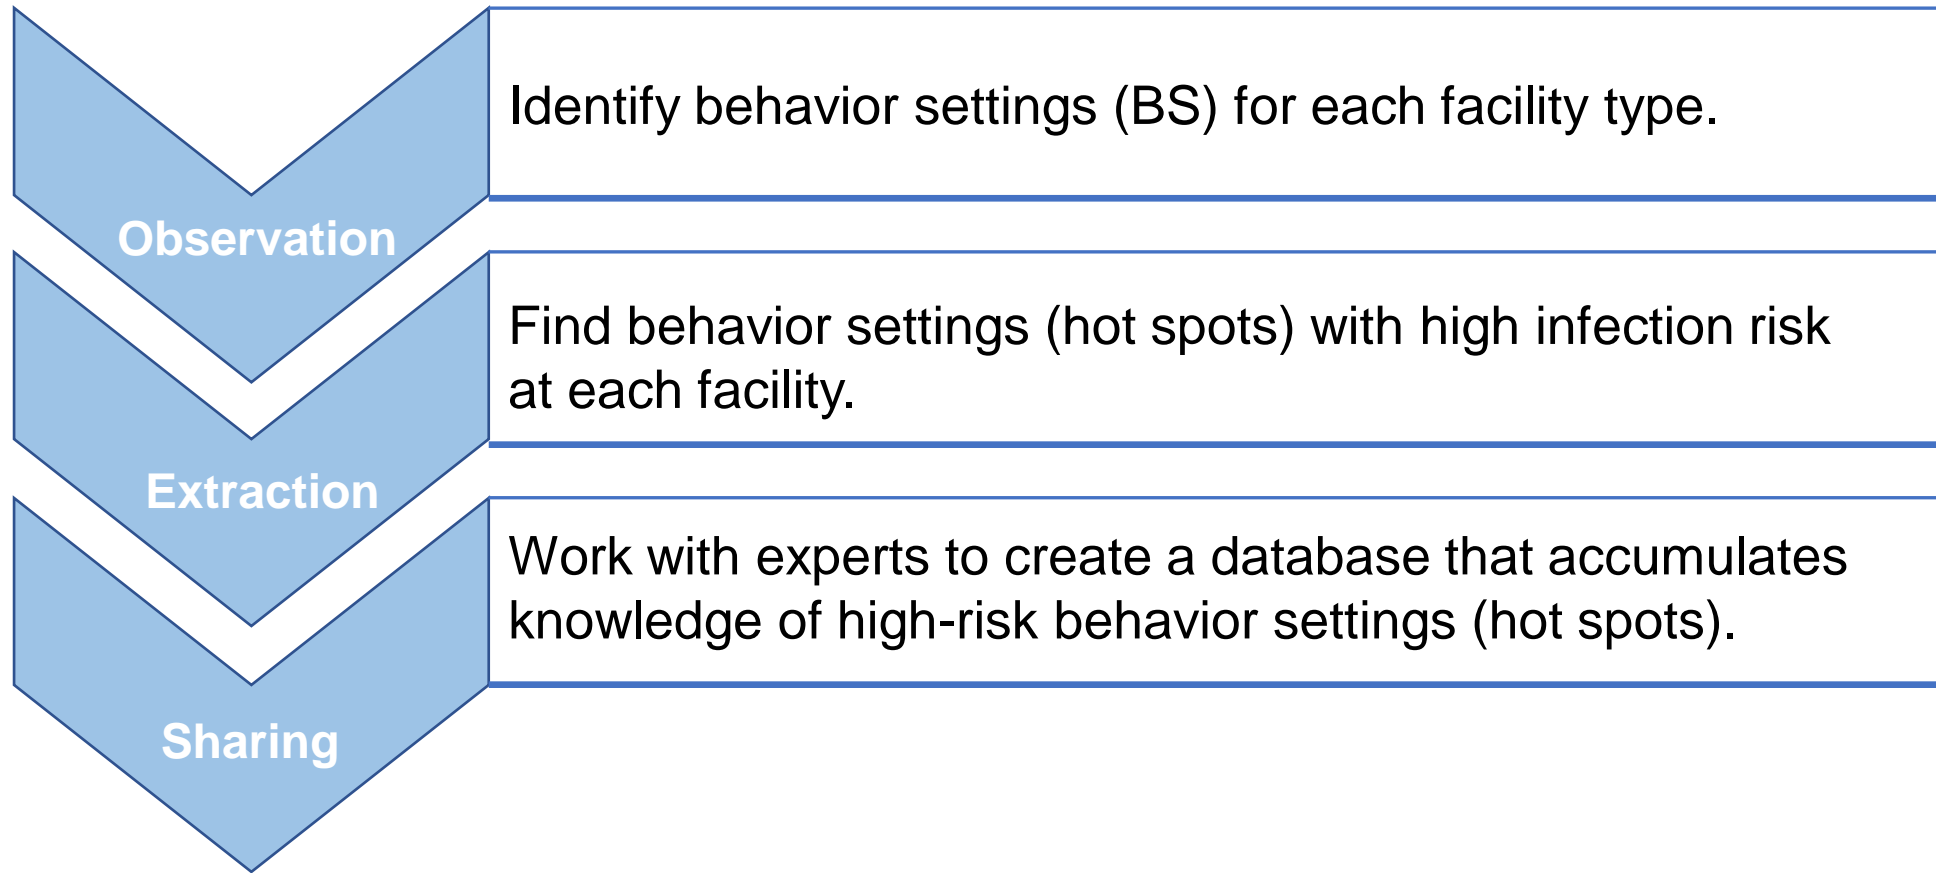

{

 When  
 Where  
 Whose behavior
 
}

creates infection risks.

# Effective infection control measures by accumulated experiences

Effective infection control

# Review of major points
